

Abstract of the Disclosure

The tube, in particular for containing fluid products such as creams and cosmetic products in general, includes: a trunco-conical body (1a) having a lower part (1b) which is open for introduction of the product, and can be closed after the introduction; and also an upper part (1c) affording a passage for exit of the product from the tube. A cap (3) can be applied on the upper part (1c) of the tube for closing the passage and is connected to the upper part (1c) of the tube by a hinge element (4). The tube, the cap (3) and the hinge element (4) are all made in a single piece obtained by injection moulding.
